DocMJ provides world-class personalized care to all our patients. This special journal was developed to help you track your medication use and effectiveness. Using this journal is an important part of your overall treatment and helps you and your doctor understand what medical cannabis works best for you and your condition. Your patient journal helps your doctor individualize your care based on the information you record inside. Be sure to bring it with you on each doctor visit.

Note: Be sure to schedule your appointment with DocMJ 30 days prior to your Recommendation Renewal date to avoid any lapse in your eligibility.

Fundamentals of Medical Marijuana and Cannabidiol (CBD)

Medical benefits of marijuana have been documented for thousands of years. It is only in the past few decades that science and medicine have really begun to learn all the incredible benefits these plants can provide.

Marijuana contains hundreds of cannabinoids. There are two primary compounds with proven medicinal properties.

Tetrahydrocannabinol (THC)

is the most well-known cannabinoid and gives a psychotropic “high” feeling in most patients, but has been shown to have incredible medicinal effects when taken with the other cannabinoids in the plant. The reduced effects include pain relief, inflammation, drowsiness, and appetite stimulation. Research also suggests it helps patients with nausea, convulsions, and mental health conditions such as anxiety and PTSD. When you think of THC, think of it having an acute effect and providing immediate symptom relief.

Cannabidiol (CBD)

is the other primary compound that provides therapeutic benefits, but without producing the psychotropic effects patients may feel with THC. Over the past 10 years, the understanding of the medicinal benefits of CBD has grown exponentially. There is now a large body of medical research and evidence proving the efficacy of CBD in medical conditions such as inflammation, seizure frequency, muscle spasms, anxiety and chronic pain.

Understanding the different product strains

Indica Strains

- Often have a relaxing, sedative effect

Recommended for use to:

REDUCE
STRESS

RELIEVE
CHRONIC PAIN

REDUCE
ANXIETY

INSOMNIA

MUSCLE SPASMS
AND TREMORS

Sativa Strains

- Often have a focus and uplifting effect

Recommended for use to:

IMPROVE
MOOD

IMPROVE ALERTNESS
AND FOCUS

STIMULATE
APPETITE

REDUCE
NAUSEA

EASE
MIGRAINE PAIN

RELIEVE
CHRONIC PAIN

Hybrid Strains

- Of approximately 779 strains, over half are hybrids
- Have effects of both Indica and Sativa strains which can reduce unwanted symptoms of either strain while keeping the benefits of each.

Recommended for use to:

LIMIT ANXIETY
INDUCING EFFECT OF
SATIVA STRAINS

LIMIT SEDATING
EFFECTS OF
INDICA STRAINS

CHRONIC
PAIN
RELIEF

SYMPTOMS

There are two product types to consider when selecting your medication; high CBD to THC products or low CBD to THC products.

1. High weighted CBD to THC products (such as the following CBD:THC ratios; 12:1, 5:1, 1:1) have a lower risk of psychoactive effects and are used to relieve the following symptoms:

INFLAMMATION

ANXIETY

SEIZURES

CHRONIC PAIN

MUSCLE SPASMS

2. Low weighted CBD to THC products (such as the following CBD:THC ratios; 1:12, 1:5, 0:1) have psychoactive effects and are used to relieve the following symptoms:

INFLAMMATION

NAUSEA

APPETITE
STIMULATION

CHRONIC PAIN

INSOMNIA

The statements, charts, and guidance in this journal are not intended for medical advice nor to be relied upon, or a substitute for, professional medical advice, diagnosis, or treatment. Always seek the advice of your physician or other qualified health provider with any questions you may have regarding any medical condition. Never disregard professional medical advice or delay in seeking it because of something you have read in this guide.

High THC to CBD ratio

CBD:THC DOSAGE CHART

PATIENT RECOMMENDATIONS

- For patients with no cannabis experience, start with heavily weighted CBD products and lowest strength of milligrams; generally, around 5-10 milligrams for most products.
- If using sublingual (under tongue) or oral routes, do not re-dose for at least 6 hours.
- If using a vaporizer, do not re-dose for at least 4 hours.
- If using a vaporizer, a 3 second inhalation delivers approximately 15 mg.

Method	Vaporizing/ Metered Dose Inhaler	Oral	Sublingual	Topical/ Patch
Onset (min)	~5	~60 – 80	~15 – 40	~30 - 90
Duration (h)	~2 – 4	~4 – 6	~4 – 6	~8 - 72
Advantages	Rapid onset advantageous for acute or episodic symptoms (nausea/muscle spasms/pain).	May be more advantageous for chronic disease/symptoms due to longer duration.	Onset more rapid than oral method. Can have longer duration of action compared to inhalation. Improved bioavailability compared to oral.	Less systemic effect, good for localized symptoms.
Disadvantages	Dexterity required, inhalation technique results in varying amounts.	Titration challenges due to delayed onset. Absorbed more slowly & less bioavailability.	Absorption may be more unpredictable compared to other methods.	Local effect, very slow absorption.
